

Distribution of 2023 GDP Per Capita (NAICS 71)

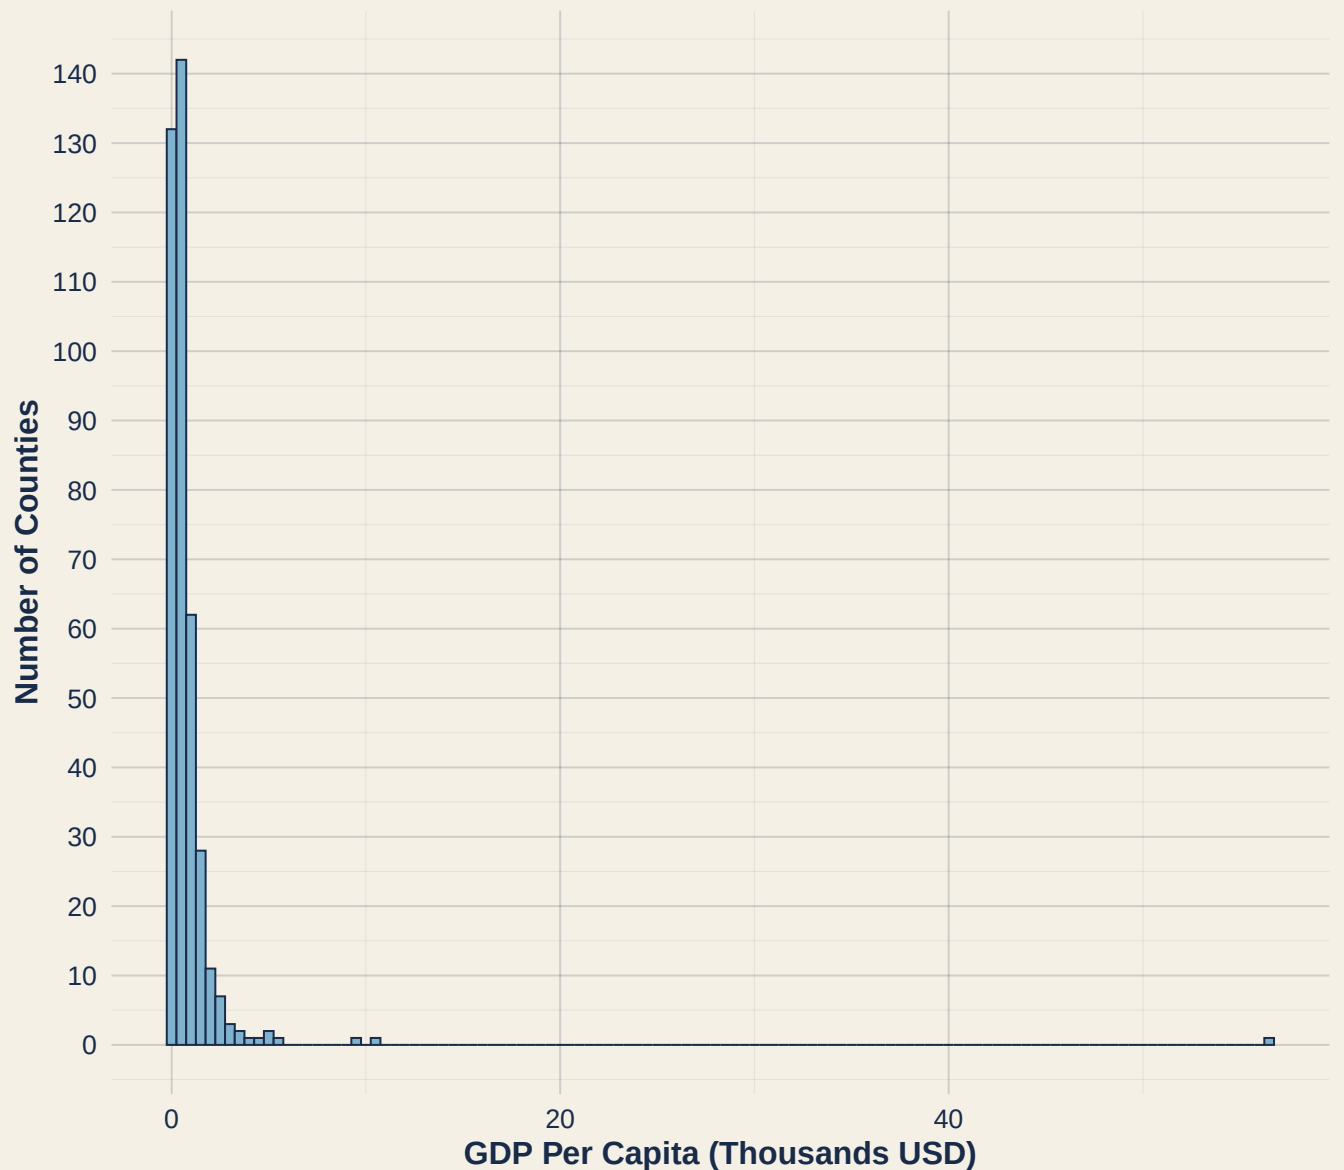

Figure 1 shows the distribution of 2023 NAICS 71 GDP per capita across metropolitan counties. The histogram indicates that most counties are concentrated at lower-to-moderate values, with a smaller right tail at higher GDP per-capita levels.

Distribution of $\text{Log}(1 + \text{GDP Per Capita})$ in 2023 (NAICS 71)

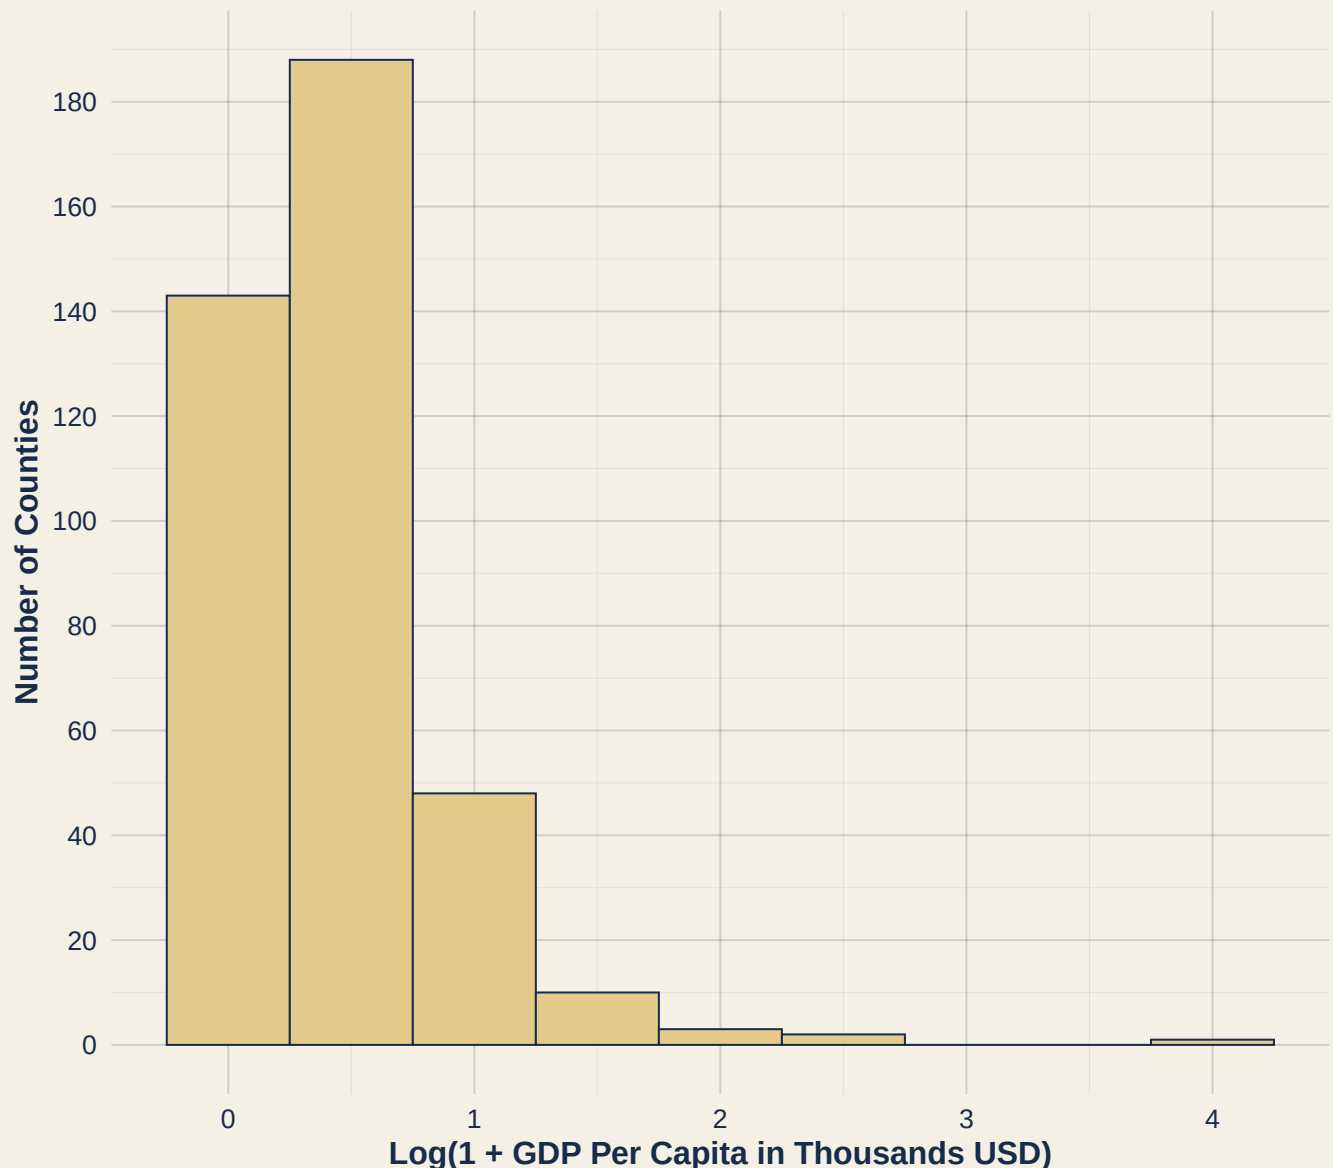

Figure 2 shows the distribution of $\text{log}(1 + 2023 \text{ NAICS } 71 \text{ GDP per capita})$. The log transform compresses the right tail, yielding a less skewed distribution that is more suitable for linear regression analysis.

Average Log GDP Per Capita (NAICS 71): Eras Tour Host vs Non-Host

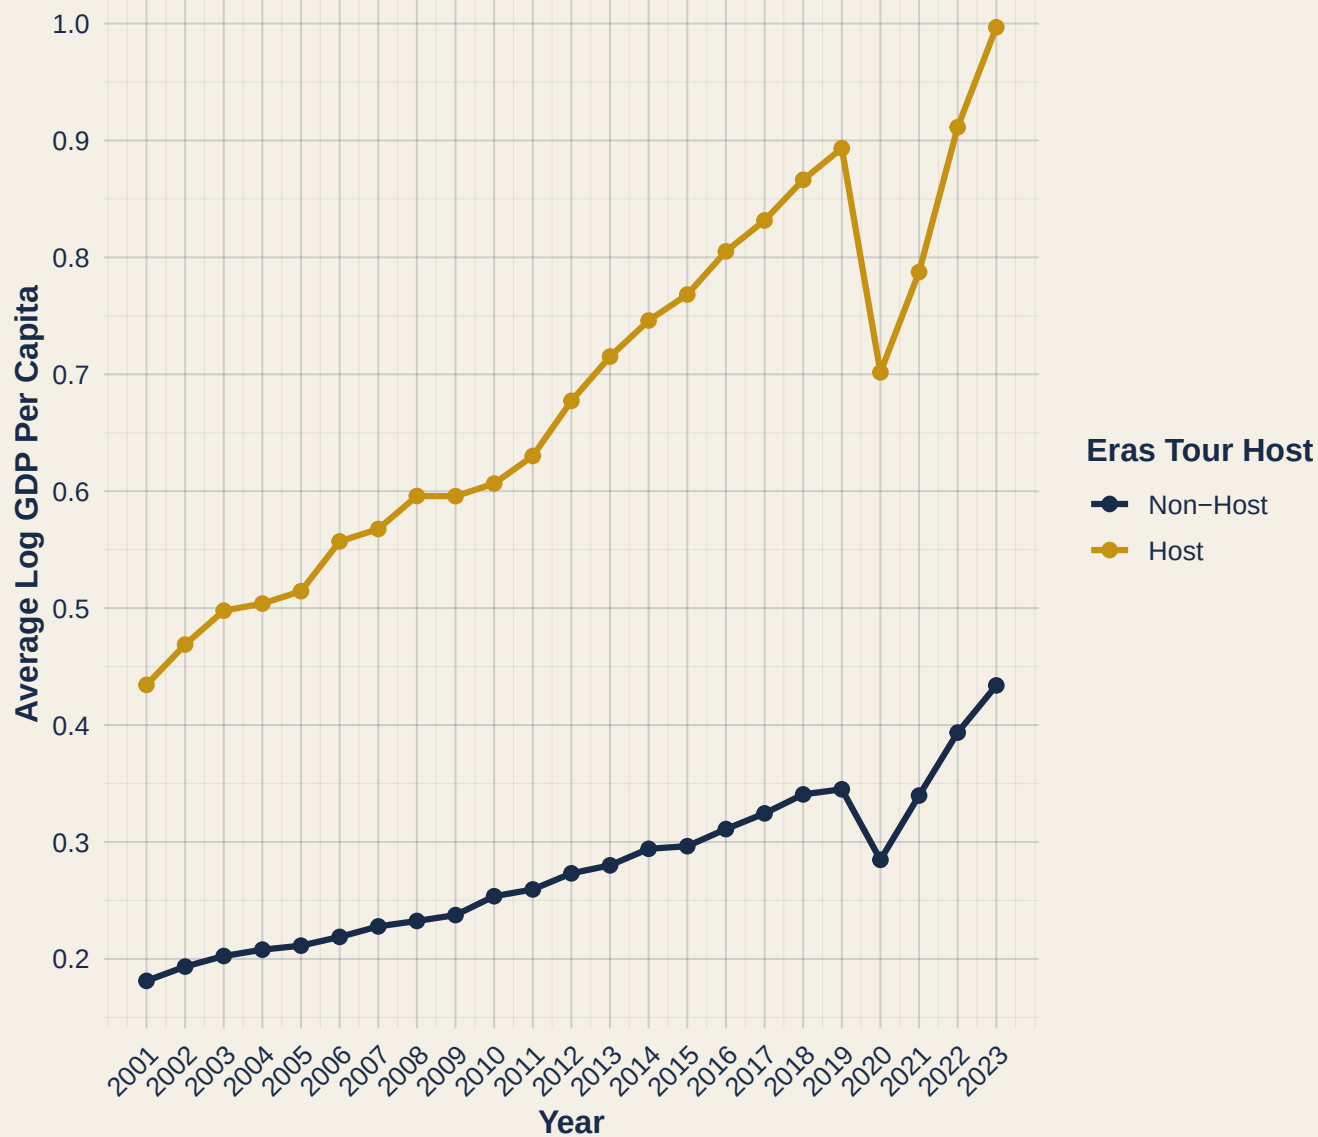

Figure 3 shows average log GDP per capita trends from 2001–2023 for Eras Tour host and non-host counties in NAICS 71. Host counties consistently show higher average log GDP per capita than non-host counties over time, and both groups show upward long-run trends.

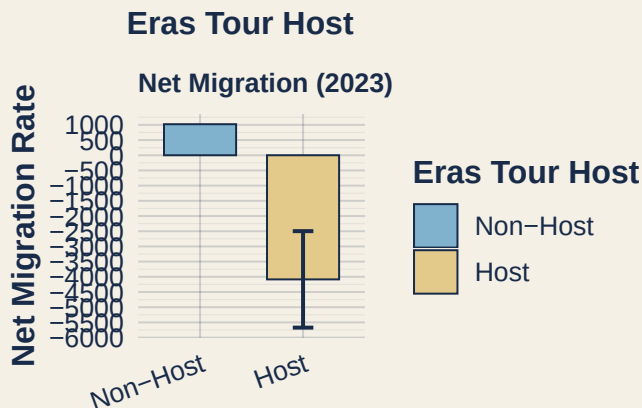

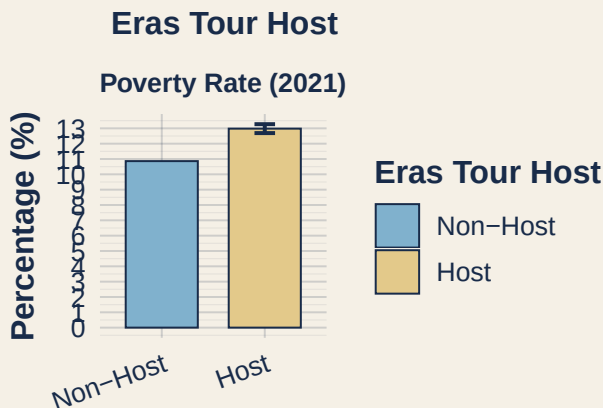

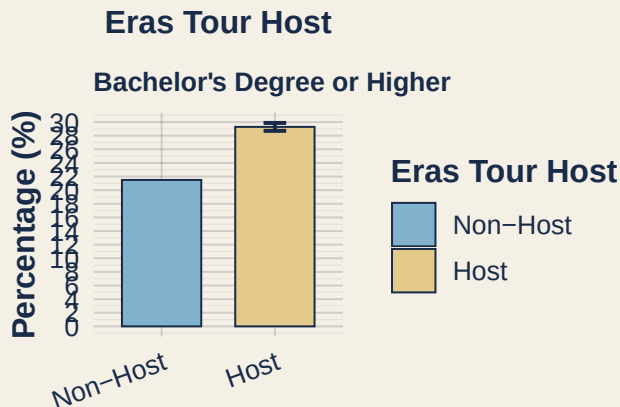

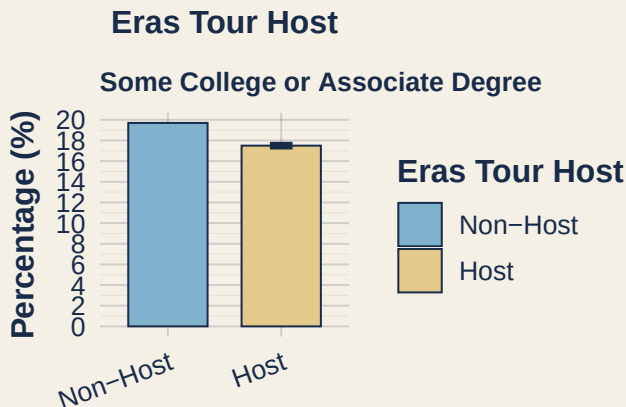

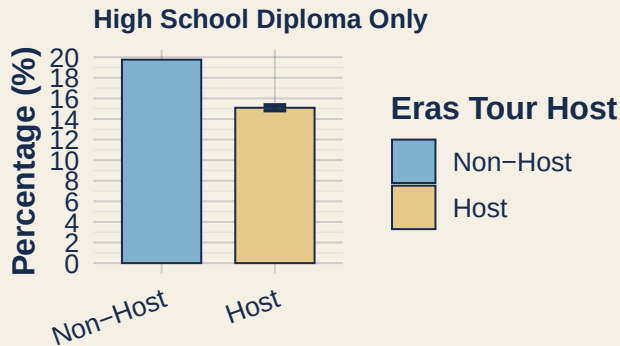

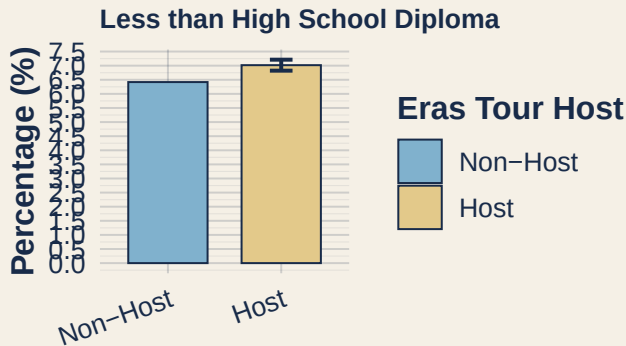

Figure 4 compares demographic and socioeconomic averages between Eras Tour host and non-host counties, with treated-intervals shown for each metric.
